

Startup Mindset with Agile and AI

From Idea to MVP Using Scrum

A comprehensive 3-day workshop designed for post-graduate to master the integration of AI tools with Agile methodologies. Transform your startup ideas into validated MVPs using Scrum, Lean Startup principles, and cutting-edge AI assistance.

Waleed Kamel

Your Agile AI Workshop Coach

Waleed is a seasoned Digital Transformation Leader with over 20 years of experience, specializing in driving large-scale change and implementing enterprise platforms in complex, regulated industries.

Expertise & Leadership

- Former Managing Director & CDO, adept at aligning business strategy, technology, data, and change.
- Expert in translating business needs into Agile delivery roadmaps.
- Led and coached cross-functional teams of 100+ across product, engineering, data, and operations.
- Hands-on experience applying AI and data analytics to improve decisions, customer experience, and efficiency.
- Advisor on digital business models, including FRA-compliant real estate tech.

Education

- MBA, ESLSCA Business School, France
- B.Sc. in Computers & Systems Engineering, Egypt

Certifications

- Digital Transformation Platform Strategies, MIT
- Artificial Intelligence: Implications for Business Strategy, MIT
- FinTech & Leading Digital Transformation, Silicon Valley
- Certified Product Manager (CPM)
- Agile Project Management Certified PMI-ACP
- Certified COBIT 2019 & AWS Cloud Practitioner

Outcomes by Day

Day 1: Discovery

Idea validation, personas, MVP scope using Lean Startup method, ChatGPT, and build MVP with Lovable

Day 2: Process

Scrum framework, backlog management, prioritization, project planning, and Jira setup

Day 3: Execution

Sprint execution, Zoom AI summaries, Make automation, and Gamma pitch deck

Every day produces tangible outputs you can use immediately in your startup journey.

Workshop Kickoff: Setting the Foundation

Clear Outcomes

Each day produces tangible outputs. We prioritize speed and clarity over perfection, ensuring you leave with actionable deliverables.

Team Structure

Product Owner drives value, Scrum Master removes impediments, Developers own delivery and technical quality.

AI Toolchain

ChatGPT, Claude, Make, Zapier, Lovable, NotebookLM, Gamma, and Jira work together to accelerate every phase from discovery to deployment.

Working agreements and timeboxes will be established to ensure efficient collaboration throughout the workshop. This structured approach creates transparency and sets expectations early.

Tools We'll Use

ChatGPT & Claude

AI-powered thinking, writing, and content generation for rapid ideation and refinement

Make, Zapier & Lovable

Build MVP quickly and automate feedback workflows without heavy coding

Gamma & Jira

Create pitch decks and manage Scrum execution professionally

Zoom AI

Auto-summarize meetings and extract action items for team continuity

Day 3 Goal

Execute

Run Real Sprint Execute a complete sprint workflow		Track in Jira Maintain professional work visibility
Automate Feedback Build Make workflow for user stories		Create Pitch Deck Produce investor-ready Gamma deck

Today is execution and packaging the startup story. We bring everything together into a complete system.

Sprint Planning

Required Inputs

Planning is selecting a goal and a realistic set of work that supports it. Quality planning prevents mid-sprint chaos.

Sprint Goal: The North Star

Enable consultant discovery

A sprint goal is an outcome statement that guides all sprint decisions. It's not a task list—it's the *why* behind the work. When faced with trade-offs or scope questions, the team asks: "Does this support the sprint goal?"

"A good sprint goal gives the team flexibility in how they achieve the outcome while maintaining focus on what matters most."

Teach the habit of saying no. Overcommitment creates spillover, destroys trust, and makes velocity unpredictable. A focused sprint with a clear goal beats an overloaded sprint every time.

Sprint Backlog Selection

- **Pull top items that support the goal**
Choose stories that directly contribute to achieving the sprint goal
- **Avoid overload**
Commit to what the team can realistically complete based on historical velocity
- **Identify dependencies**
Flag any blockers or external dependencies that could impact delivery

Teach the "say no" muscle. It's better to under-commit and over-deliver than to set unrealistic expectations.

Capacity Planning and Story Selection

Calculate Capacity

Team availability × historical velocity = sprint capacity.

Example: 3 developers × 8 hours/day × 10 days = 240 hours.

Historical velocity: 28 points. Capacity: ~28 points.

Selection Strategy

Pull highest priority stories that fit capacity and support the sprint goal. Leave buffer for unknowns (10-20%).

Story	Points	Priority
Search consultants by expertise	5	Must
View consultant profile	3	Must
Filter by availability	3	Should
Sort search results	2	Should
Save search preferences	5	Could

Selected: 13 points (leaves buffer for unknowns)

Execution and Tracking in Jira

Daily Updates

Keep Jira current. Move cards as work progresses. Transparency enables the team to adapt and help each other.

WIP Control

Limit work in progress to reduce context switching. Finish stories before starting new ones. Focus on throughput, not activity.

Blocker Handling

Mark blockers immediately and escalate fast. Blockers are system problems to solve, not individual failures.

Board-Driven Decisions

Use the board to drive daily decisions. If the board is stale, the sprint is blind. Make the board your single source of truth.

Task Breakdown and Ownership

After selecting stories, break them into tasks for execution. Tasks help developers coordinate work and track progress within a story. Each task should be small enough to complete in a day or less.

Story: Search Consultants

- Design search UI component (4h)
- Implement search API endpoint (6h)
- Connect UI to API (3h)
- Add loading and error states (2h)
- Write unit tests (3h)

Assign owners and expected completion order. Explicitly track risks and dependencies. Tasks ensure developers can coordinate, while stories ensure user value is delivered.

Jira Dashboards and Reports

Sprint Burndown

Track remaining work throughout the sprint to identify if you're on track

Velocity Chart

Historical view of completed points per sprint for forecasting

Sprint Report

Comprehensive view of what was completed, added, or removed during sprint

Reports help conversation, not policing. Use data to identify patterns and improve, not to blame individuals.

Sprint Report and Velocity Dashboard

28

Completed Points

Story points completed in the sprint. This becomes your velocity for forecasting.

3

Carried Over

Stories not completed and moved to next sprint. Analyze why—unclear criteria? Underestimated? Blocked?

2

Scope Added

Stories added mid-sprint. Frequent additions indicate poor planning or weak Product Owner boundaries.

Use dashboards to support conversations and decisions, not micromanagement. The goal is learning and improvement, not blame or performance ranking.

Sprint reports answer: What did we complete? What didn't we complete and why? What did we learn about our process and capacity?

Jira Dashboards: Burnup Chart

Burnup charts show two lines: Total Scope (can increase) and Completed Work (should trend upward). The gap between lines is remaining work.

How to read it: If Completed Work is flat, check for blockers, too much WIP, or unclear acceptance criteria. If Total Scope keeps jumping, enforce a change rule: add scope only if it replaces equal scope.

Understanding Burnup vs Burndown

Why Burnup is Better

Burnup stays readable even when scope changes, which happens constantly in real startup work. It makes scope changes visible rather than hiding them.

Burndown charts assume fixed scope. When scope changes, the chart becomes misleading and teams lose trust in the data.

Coaching with Burnup

- Flat Completed Work line → Check blockers and WIP
- Jumping Total Scope line → Enforce change control
- Widening gap → Sprint goal at risk, replan
- Lines converging → On track to meet goal

Sprint Review: Demo and Feedback

Sprint Review is where the team demos the increment to stakeholders and collects feedback. It's not a status meeting—it's a working session that steers the product direction.

1 Demo Increment

Show working software, not slides. Walk through user journeys and completed stories.

2 Collect Feedback

Gather reactions, questions, and suggestions. Capture exact quotes and feature requests.

3 Adjust Priorities

Product Owner updates backlog based on feedback. New insights may change what's built next.

Review steers the product. The feedback loop from stakeholders to backlog should be fast—ideally same day or within 48 hours.

Sprint Retrospective: Improve the System

Identify Improvements

What went well? What didn't? What should we try differently? Focus on system issues, not individual blame.

Assign Owners

Each improvement needs an owner and due date. Vague commitments lead to no action. Make it concrete.

Set Due Dates

Improvements should be implemented before or during the next sprint. Track them like any other work item.

Use Zoom AI to summarize themes and action items. This reduces admin work and improves follow-through. Retro outputs feed process improvements, while Review outputs feed the backlog.

Zoom AI Support

Review and Retro Enhancement

Auto Summary

Zoom AI generates meeting summaries automatically, capturing key discussion points

Action Items Extraction

AI identifies and lists action items with owners from meeting transcript

Share Notes

Distribute summaries to team immediately after meeting for continuity

Zoom AI reduces admin work and improves continuity. No more manual note-taking or lost action items.

Feedback Loop Design

Before Automation

Channel

In-app widget, feedback form, email, or support ticket

Taxonomy

Bug, usability issue, feature request, pricing question, trust/safety concern

Severity and Impact

Critical, high, medium, low based on user impact and frequency

Automation without a taxonomy creates garbage backlog. Design the classification system first.

Make Automation

Feedback to Jira Stories

Trigger

New feedback submission via form, email, or API

Processing Steps

Deduplicate against existing issues, classify by type, cluster similar feedback, score by impact

Output

Jira issue auto-created with appropriate type, priority, and linked to relevant Epic

Show the pipeline visually. Explain how AI text classification maps feedback to backlog categories and priorities.

Fundraising and Sales Deck Sprint

STARTUP PITCH DECK:

[Company Name]

A brief, product-focused description

1

ChatGPT: Draft Content

Generate slide copy and talking points for 10-slide narrative

2

Gamma: Create Deck

Transform content into visually compelling slides with charts and images

3

Team: Refine

Add specific metrics, customer quotes, and demo screenshots

4

Practice: Deliver

Rehearse pitch, time each section, refine based on feedback

Your deck is a decision document. Make it clear, quantified, and consistent with MVP and roadmap.

Fundraising and Sales Deck Sprint

Use ChatGPT to draft slide copy and talking points, then Gamma to create the deck and visuals quickly. Your deck is a decision document—make it clear, quantified, and consistent with your MVP and roadmap.

1

Problem

Pain point and market gap

2

Solution

Your product and differentiation

3

Why Now

Market timing and trends

4

Market

TAM, SAM, SOM analysis

5

Product

Demo and roadmap

6

Business Model

Revenue and unit economics

7

Go-to-Market

Acquisition and growth strategy

8

Team

Founders and advisors

9

Ask

Funding amount and use of funds

Pitch Deck: Key Metrics and Visuals

Funnel Metrics

Roadmap Timeline

- Q1 2024: MVP Launch - Consultant discovery and booking
- Q2 2024: Trust Features - Verification, reviews, ratings
- Q3 2024: Scale Features - Payments, analytics, mobile app
- Q4 2024: Growth - API, integrations, enterprise features

Include concrete metrics and timelines. Investors want to see traction and a clear path to scale. Make your deck data-driven and realistic.

Conclusion!

Reusable Workflow: Apply to Any Startup Idea

Discovery Phase

Customer interviews, competitor analysis, persona development, value proposition design using Lean Startup principles.

Definition Phase

PRD creation, backlog building, story writing, estimation using Scrum framework and AI assistance.

Implementation Phase

Sprint planning, execution, review, retrospective using Scrum ceremonies and Jira tracking.

Launch Phase

MVP deployment, feedback automation, pitch deck creation, fundraising using AI-accelerated workflows.

This workflow is repeatable for any startup idea and any product team. The combination of Lean Startup, Scrum, and AI tools creates a powerful system for rapid, validated product development.

Key Takeaways: Agile AI for Startups

Lean Startup Decides What

Use Build-Measure-Learn loops to validate hypotheses and reduce risk.
Focus on learning, not just building.

Scrum Delivers How

Use Scrum framework to deliver value in increments with transparency and continuous improvement.

AI Accelerates Speed

Use AI tools to draft, review, automate, and visualize—but humans make final decisions and apply judgment.

Customer Centricity Wins

Build a system to capture, analyze, and act on customer feedback within 48 hours. Speed of learning is competitive advantage.

Metrics Drive Decisions

Define success metrics upfront. Use data to decide whether to pivot or persevere, not opinions or assumptions.

Tools Enable, Process Guides

Tools like Jira, Make, Lovable, and Gamma are enablers. Process discipline and team collaboration are what actually deliver results.

Workshop Capstone Outputs

1

PRD Completed

Comprehensive product requirements document with personas, user journeys, and success metrics

2

Jira Backlog

Prioritized backlog with epics, stories, acceptance criteria, and estimates ready for execution

3

Lovable MVP

Working web application demonstrating core user flow from search to booking intent

4

Make Automation

Feedback-to-Jira pipeline running automatically, converting user input to actionable stories

5

Gamma Pitch Deck

Investor-ready presentation with narrative, metrics, roadmap, and ask

Your Journey Starts Now

From Idea to MVP in 3 Days

You now have a complete toolkit and repeatable process for transforming startup ideas into validated MVPs. The combination of Lean Startup principles, Scrum framework, and AI-powered tools gives you a significant competitive advantage.

3

Days

From idea to working MVP with
validated customer insights

5

Deliverables

PRD, Backlog, MVP, Automation,
Pitch Deck—all production-ready

∞

Applications

Apply this workflow to any
startup idea, any product, any
team

The best way to predict the future is to build it. Start with customer problems, validate with MVPs, iterate with Scrum, and accelerate with AI. Your startup journey begins today.

Thank you
