

Startup Mindset with Agile and AI

(Day 2 – Build & Process)

Contents

- 1. Product Backlog..... 2
- 2. “Jira” Setup with Product Backlog 2

1. Product Backlog

Role

You are a senior Product Owner and Scrum backlog writer.

Context

Country: {{COUNTRY}}

Industry: {{INDUSTRY}}

Idea name: {{IDEA_NAME}}

Idea description: {{IDEA_DESCRIPTION}}

Previous step outputs (only source of truth):

- PROBLEM_DISCOVERY_OUTPUT = (Consider the results from the previous Problem Discovery step)
- COMPETITORS_ANALYSIS_OUTPUT = (Consider the results from the previous Competitors Analysis step)
- PERSONAS_OUTPUT = (Consider the results from the previous Personas creation step)
- MVP_SCOPE_OUTPUT = (Consider the results from the previous MVP Scope step)

Objective

Create the MVP backlog by selecting the most important 6 to 8 features for {{IDEA_NAME}}, then writing up to 6 user stories per feature that directly support the MVP promise for the primary persona.

Output format

Return one table only with these columns:

- Feature #
- Feature
- User story name
- User story summary (As a..., I want..., so that...)

Tone

Practical, direct, delivery-focused.

Constraints

- Exactly 6 to 8 features
- Up to 6 user stories per feature (2–6 is fine)
- Each user story summary must be one line
- No epics, no acceptance criteria, no estimates
- No extra text outside the table

Example parameters (with values)

- COUNTRY = Egypt
- INDUSTRY = Automotive Platform
- PRODUCT_TITLE = ConsultNow Platform
- IDEA_DESCRIPTION = A business growth consultation service platform where clients find consultants, book sessions, pay securely, and get outcomes. Trust and speed are the core value propositions.

2. Affinity Estimates

Role

You are a senior Agile coach and Scrum Master. You will estimate user stories using Affinity Estimation (relative sizing), then bucket them into 3 size columns.

Context

Country: {{COUNTRY}}

Industry: {{INDUSTRY}}

Idea name: {{IDEA_NAME}}

Idea description: {{IDEA_DESCRIPTION}}

Only source of truth

- PRODUCT_BACKLOG_OUTPUT = (Consider the results from the previous Product Backlog step)

Objective

Estimate the user stories in PRODUCT_BACKLOG_OUTPUT using Affinity Estimation and group them into 3 relative sizes:

- S = 100 points

- M = 200 points

- L = 400 points

Then output a single table with 3 columns (S-100, M-200, L-400) listing the user stories assigned to each size.

How to estimate (Affinity Estimation rules)

1) Parse PRODUCT_BACKLOG_OUTPUT into a flat list of user stories (keep Feature # + Feature name + User story name).

2) Pick anchors:

- Choose 1 clear small story as an S anchor.

- Choose 1 medium story as an M anchor (roughly 2x S).

- Choose 1 large story as an L anchor (roughly 2x M or 4x S).

3) Affinity sort the rest by comparing each story to the anchors on these factors:

- UI complexity (simple display vs multiple states, modals, forms)

- Data complexity (static content vs CRUD, storage, multiple entities)

- Validation and error handling (none vs multiple rules, cross-field validation)

- Workflow steps (single action vs multi-step flow)

- Integrations or external touchpoints (none vs email, placeholder payment, notifications)

- Uncertainty (clear requirement vs ambiguous requirement)

4) Place each story into S, M, or L:

- S (100): small, straightforward, low risk, limited states

- M (200): moderate complexity, multiple states or validations

- L (400): multi-step, higher risk/uncertainty, multiple components, edge cases

5) Quality checks:

- Keep similar stories sized consistently.

- If a story seems too big, keep it in L and append "(Candidate to split)" to the story name.

- Do not create new stories, only estimate and bucket existing ones.

Output format (mandatory)

Return ONE table only with these columns:

- S (100 pts)

- M (200 pts)

- L (400 pts)

Table cell content rules

- Each cell contains a line-separated list of user stories.

- Each story line format must be:
[Feature #] Feature name, User story name
- Do not include summaries inside the table, only identifiers.
- No extra text before or after the table.

Constraints

- Use only the user stories provided in PRODUCT_BACKLOG_OUTPUT, do not invent stories
- Do not use Planning Poker
- Do not output anything except the table
- If a story is unclear, still place it, and append "(Uncertain)" to the story name
- Keep the sizes strictly to S=100, M=200, L=400

Example parameters (with values)

- COUNTRY = Egypt
- INDUSTRY = Automotive Platform
- PRODUCT_TITLE = ConsultNow Platform
- IDEA_DESCRIPTION = A business growth consultation service platform where clients find consultants, book sessions, pay securely, and get outcomes. Trust and speed are the core value propositions.

PRODUCT_BACKLOG_OUTPUT = (Consider the results from the previous Product Backlog step)

3. "Jira" Setup with Product Backlog

Role

You are a senior Scrum Product Owner and Jira import specialist.

Context

Country: {{COUNTRY}}

Industry: {{INDUSTRY}}

Idea name: {{IDEA_NAME}}

Idea description: {{IDEA_DESCRIPTION}}

Input backlog (generated in the previous step, use it as the only source of truth):

PRODUCT_BACKLOG_OUTPUT = (Consider the results from the previous Product Backlog step that produced the Features and User Stories)

AFFINITY_ESTIMATE_OUTPUT = (Consider the results from the previous Affinity Estimate step that assigned each user story to S=100, M=200, or L=400)

Target CSV columns (comma-delimited, exact order):

1. Issue Type
2. Work Item ID
3. Summary
4. Description
5. Parent
6. Priority
7. Story Points
8. Assignee

Objective

Convert PRODUCT_BACKLOG_OUTPUT into a Jira-ready CSV file where:

- Each Feature becomes an Epic row

- Each User Story becomes a Story row
- Every Story links to its Epic using Parent = Work Item ID of the Epic
- Work Item ID is sequential and unique across all rows (Epics and Stories)
- Story Points for each user story are assigned based on AFFINITY_ESTIMATE_OUTPUT and MUST be 100, 200, or 400 only

Story Points mapping rule (mandatory)

- If a user story is in S (100), set Story Points = 100
- If a user story is in M (200), set Story Points = 200
- If a user story is in L (400), set Story Points = 400

Output format

1. Export the result as a downloadable CSV file named: {{IDEA_NAME}}_Backlog_Import.csv
2. The first row must be the header exactly as:
Issue Type,Work Item ID,Summary,Description,Parent,Priority,Story Points,Assignee
3. Then one row per Epic and Story, grouped like this: Epic row first, then its Story rows, then next Epic, etc.

CSV formatting rules (mandatory)

- Comma delimiter only
- If any field contains a comma, wrap the field in double quotes
- If any field contains a double quote, escape it as two double quotes
- No extra columns
- No blank lines

Constraints

- Issue Type must be exactly Epic for features and Story for user stories
- Work Item ID must be sequential and unique across all rows, use format: WI-001, WI-002, ...
- Summary must be the feature name or story name
- Description must be one line (brief). For Epics: a short epic description, or leave empty if not available
- Parent must be empty for Epics, and must contain the Epic Work Item ID for Stories
- Priority is required only for Stories (use 1 to 10, where 1 is highest). Leave empty for Epics
- Story Points are required only for Stories and MUST be set using the Story Points mapping rule above. Do NOT use Fibonacci values (1,2,3,5,8,13)
- Assignee must be empty for all rows
- No citations, no links, no explanations outside the file

Example parameters (with values)

- COUNTRY = Egypt
- INDUSTRY = Automotive Platform
- IDEA_NAME = ConsultNow Platform
- IDEA_DESCRIPTION = A business growth consultation service platform where clients find consultants, book sessions, pay securely, and get outcomes. Trust and speed are the core value proposition.
