

Nestjs Course

Lab 3

Implementation of Database Schema and Migrations using TypeORM

1- Create the following schema

Entities:

Order{ Id , Amount , Longitude , Latitude , Client , PaymentMethod
(Cash or Visa), Products }

Product { Id , Name , Price , Orders }

User {Id , Username, Email , Password , Orders }

Relationships:

(Order , Product) => Many to Many

Each Order contains Many Products

Each Product can be ordered in Many Orders

(User , Order) => One to Many

Each User can make Many Orders

2- Create Migration to apply this schema on database

3- Apply the Migration on database

4- Implement the following Endpoints

- GET /products Get All Products
- POST /products Create Product
- POST /orders Create Order
- GET /orders/:id Get Order Details
 including Client details and Products included in the order

5- Apply Jwt Authentication using Passport js

With the following endpoints

- /auth/signup POST
- /auth/signin POST

6- Protect all your order & product endpoints with guard to check that the user is authenticated

7- Apply a mechanism to be able to validate the jwt access token and then make the user available to use through different controllers
