Day 5

JavaScript Fundamentals cont.

JavaScript Built-in Objects cont.

Array Object

- Array is actually a special type of object
- Array is a data structure that used to represent list of items
- It has **length** property:
 - ▷ gives the length of the array
 - ▷ It is one more than the highest index in the array
- To declare an array use
 - ▷ new keyword
 - ▷ array literal notation

Array Object

- Using new operator:

→ `var colorArray = new Array();`
`colorArray [0]="red";`
`colorArray [1]="blue";`
`colorArray [2]="green";`

OR

→ `var colorArray = new Array(3);`
`colorArray [0]="red";`
`colorArray [1]="blue";`
`colorArray [2]="green";`

OR

→ `var colorArray = new Array("red","blue","green");`
`//this is called dense array where array is populated at the time it is declared`

- Use array literal notation

→ `var arr = ["apple", "banana", "grapes"];`
→ `var arr = [ , 1, , , "a"];`

Array Object Methods

```
var arr1=new Array("A","B","C");
```

```
var arr2 = new Array(1,2,0);
```

Name	Example	Result
concat	arr1.concat(arr2);	A,B,C,1,2,0 //neither arr1 nor arr2 changed
join	arr1.join() arr1.join("*")	A,B,C A*B*C //arr1 not changed
reverse	arr1.reverse()	C,B,A
pop	arr1.pop()	C // and arr1.length becomes 2
push	arr1.push("D");	4 // 4 → Length of the array // resulting in : arr1[3]="D"

Array Object Methods

```
var arr1=new Array("A","B","C");
```

```
var arr2 = new Array(4,2,3,0);
```

Name	Example	Result
shift	arr1.shift();	Returns: A arr1[0] ="B" & arr[1]="C"
unshift	arr1.unshift("D");	arr1[0]="D" //length become 4
slice	arr1.slice(1); arr1.slice(2);	B,C C //arr1 not changed
sort (according to Unicode)	arr2.sort()	0,2,3,4

Other Useful Methods

Method name
toReversed()
toSorted()
toSpliced()
with()
at()
fill()
flat()
indexOf()
include()

Associative Array

- The Arrays That Aren't
 - JavaScript has no pure associative array.
 - Associative array is just like an ordinary array, except that instead of the indices being numbers, they're **strings**, hence they do not have a length property.
 - The indices are replaced by user defined keys.
 - Although the keys for an associative array have to be strings, the values can be of any data type, including other arrays or associative arrays.
 - Associative array is simply a set of key-value pairs
- The key idea is that every JavaScript object is an associative array which is the most general sort of array you can invent - sometimes this is called a hash or map structure or a dictionary object.

Associative Array

- **Example:**

```
var assocArray = new Array( );  
assocArray["one"] = "one";  
assocArray["1"] = "two";  
assocArray["Next Value"] = "Three";  
assocArray["new"] = 2;
```

```
for (let i in assocArray)  
  console.log(i+": "+ assocArray[i]);
```

Objects are Associative arrays

Object Object

- **Object** is the **parent** of all JavaScript objects, which means that every object you create inherits from it
 - **Reminder** : the **Global** object is **window** object
- To create an object
 - `var obj = { };` → preferable way
 - `var obj = new Object( );`
- Object object has **constructor** property that used to return the constructor function of the created Object.
- Objects are considered **Associative Arrays** also called a **hash** (the keys are strings)

JavaScript uses **Arrays** to
represent **indexed** arrays
&
Objects to represent
associative arrays.

Object Object

```
//old way of creating an object  
var obj = new Object();  
//new way of creating an object (Literal notation)  
//var obj={ };  
// adding property to object obj  
obj.name = "JavaScript";//dot notation → preferable approach  
//obj["name"] = "JavaScript";// subscript notation
```

```
var obj = {  
    // adding property to object obj  
    name : "JavaScript",  
    // "name" : "JavaScript",  
};
```

Example!

Date Object

- To obtain and manipulate the day and time in a script.
- The information either takes the value from the user's computer or from a specified date and time
- To create date object:
`var varName = new Date([parameters])`
 - Parameters are
 - Year, month, date of the month, hour, minute, second, and milliseconds
 - Example:
`var varName = new Date()`
`var varName = new Date(milliseconds)`
`var varName = new Date(datestring)`
`var varName = new Date(yr, month, date [, hrs, min, sec, msec])`

Date Object Number Conventions

Date Attribute	Numeric Range
seconds, minutes	0 - 59
hours	0 - 23
day	0 - 6 (0 = Sunday, 1 = Monday, and so on)
date	1 - 31
month	0 - 11 (0 = January, 1 = February, and so on)
year	0 + number of years since 1900

Date Object

- The Date object methods fall into these broad categories:

1. **"get"** methods

→ for getting date and time values from date objects

2. **"set"** methods

→ for setting date and time values in date objects

3. **"to"** methods

→ for returning string values from date objects.

Date Object “get” Methods

```
var now = new Date ( "November 25,2009");
```

Name	Example	Returned Value
getDate	now.getDate()	25
getMonth	now.getMonth()	10
getFullYear	now.getFullYear()	2009
getDay	now.getDay()	6
getHours	now.getHours()	0
getMinutes	now.getMinutes()	0
getSeconds	now.getSeconds()	0
getTime	now.getTime()	The internal, millisecond representation of a Date object similar to now.valueOf()

Date Object “set” Methods

```
var someDate= new Date ();
```

Name	Example
setDate	someDate.setDate(6)
setHours	someDate.setHours(14)
setMinutes	someDate.setMinutes(50)
setMonth	someDate.setMonth(7)
setSeconds	someDate.setSeconds(7)
setTime	someDate.setTime(yesterday.getTime())
setFullYear	someDate.setFullYear(88)

Date Object “to” Methods

```
var now = new Date ( "November 25,2009");
```

Name	Example	Returned value
toUTCString	now.toUTCString()	Tue, 24 Nov 2009 22:00:00 GMT
toString	now.toString()	'Wed Nov 25 2009 00:00:00 GMT+0200 (Eastern European Standard Time)'
toLocaleString	now.toLocaleString()	11/25/2009, 12:00:00 AM
	now.toLocaleString('ar-EG')	'١٢:٠٠:٠٠ ٢٠٠٩/١١/٢٥ ص'
	now.toLocaleString('ar-EG',arrDate)	11/25/2009, 12:00:00 AM
toLocaleDateString	now.toLocaleDateString()	'11/25/2009'
	now.toLocaleDateString('ar-EG')	'٢٥/١١/٢٠٠٩'

[weekday: 'long', year: 'numeric', month: 'long', day: 'numeric']

Date Object

- Hours should be specified using a **24-hour** clock.
- The **month** is always indexed from **zero**, so that November is month 10.
- The year can also be offset by 1900, so that you can use either of these two forms

```
var NovDate = new Date(90, 10, 23);  
var NovDate = new Date(1990, 10, 23);
```

- For the year 2000 and beyond you must use the second form

```
var NovDate = new Date(2006, 10, 23);
```

- This form may optionally take an additional three integer arguments for the time, so that 1:05 PM on November 23, 1990 is

```
var NovDate2 = new Date(90, 10, 23, 13, 5, 0);
```

Boolean Object

- The Boolean object is used to convert a non-Boolean value to a Boolean value (true or false).
- Everything in the language is either “truthy” or “falsy”
- The rules for truthiness:
 - ▷ 0, "", NaN, null, and undefined → falsy
 - ▷ Everything else → truthy
- You can convert any value to its boolean equivalent by applying “!!” preceding the value
 - Example:
 - !!"" → false
 - !!123 → true
- To create Boolean Object
 - ▷ var b = new Boolean(); → false // typeof is Object
 - ▷ B = false → false // typeof “boolean”

Boolean Object

- All the following lines of code create Boolean objects with an initial value of **false**:

```
var myBoolean=new Boolean()  
var myBoolean=new Boolean(0)  
var myBoolean=new Boolean(null)  
var myBoolean=new Boolean(undefined)  
var myBoolean=new Boolean("")  
var myBoolean=new Boolean(false)  
var myBoolean=new Boolean(NaN)
```

- And all the following lines of code create Boolean objects with an initial value of **true**:

```
var myBoolean=new Boolean(true)  
var myBoolean=new Boolean(1)  
var myBoolean=new Boolean("false")  
var myBoolean=new Boolean("anyThing")
```

Browser Object Model

DOM

Browser Engine & JavaScript

- **Browser engine** is a core software component of every major web browser. The primary job of a browser engine is to transform HTML documents and other resources of a web page into an interactive visual representation on a user's device.
 - e.g. **Blink**, Gecko, webkit etc.

BLINK
ENGINE

WEBKIT
ENGINE

TRIDENT
ENGINE

GECKO
ENGINE

- All Chromium-based browsers use Blink browser engine.
- **JavaScript engine** is a computer program that executes JavaScript (JS) code
 - e.g. **V8**, spiderMonkey etc.
- In 2019, **Microsoft** announced plans to rebuild the browser as **Chromium-based** with **Blink** and **V8** engines.

https://en.wikipedia.org/wiki/Browser_engine

BOM

- BOM Stands for Browser Object Model.
- BOM covers objects which relate to the browser.
- At the top of the **BOM** hierarchy is **window** object. Below that comes the
 - **navigator** object,
 - **screen** object,
 - **history** object,
 - **location** object, and
 - **document** object
 - It is the top level of the **DOM** hierarchy.

Each object below the window is of equal status.
(comes in no particular order).

They all relate directly to the window object.

BOM

- Using the **BOM**, developers can **move** the window, and perform other actions that do not directly relate to the page content.
- For some reason, the **B**rowser **O**bject **M**odel is generally not referred to by its proper name. More often, it's usually wrapped up with the **DOM**.
- In actuality, the **DOM**, which relates to all things pertaining to the document, resides *within* the **BOM**.
- Because no standards exist for the BOM, each browser has its own implementation.

JavaScript Top Object Model Hierarchy

- Every page has the following objects:
 - **window** : the top-level object; has properties that apply to the entire window.
 - **navigator** : has properties related to the **name** and **version** of the Navigator being used.
 - **document** : contains properties based on the **content** of the document, such as title, background color, links, and forms.
 - **location** : has properties based on the current **URL**.
 - **history** : contains properties representing **URLs** the client has previously **requested**.
 - **screen** : contains information about the visitor's screen.

Browser Model

Model Hierarchy

BOM is a larger representation of everything provided by the browser including any other functionality the browser may expose to JavaScript.

Window

- Window is the top level object in the JavaScript client hierarchy.
- Window is the **Global** Object
- The Window object represents a browser window.
- Window object has a set of properties & methods.
- Object Model Reference:
 window
- To reference its properties & methods:
 - [window.]property
 - [window.]method

Window Properties

Name	Description	Syntax
document	Reference to the current document object.	window.document
frames	An array referencing all of the frames in the current window.	window.frames[i]
history	Reference to the History object of JavaScript	window.history
navigator	Reference to the browser application	window.navigator
location	Reference to the Location object of JavaScript	window.location

Window Methods

Name	Description	Syntax
alert()	Displays an alert box with a message and an OK button	window.alert("Hello")
confirm()	Displays a dialog box with a message and an OK, returning true, and a Cancel, returning false	Window.confrim("Do you want to exit")
prompt()	Displays a dialog box that prompts the user for input	name=prompt("Please enter your name","")
open()	Opens a new browser window	window.open(URL, name [, features])
close()	close a specified window	window.close()
blur()	Sets focus away from the window.	window.blur()
focus()	Set calling window object on top	window.focus()
print()	Print the contents of the specified window.	window.print()

Window Methods

Name	Description	Syntax
<code>moveTo(h,v)</code>	Moves the window to horizontal and vertical position relative top-left of screen	<code>window.moveTo(,)</code>
<code>moveBy(h,v)</code>	Moves the window by + or - horizontal and vertical pixels	<code>window.moveBy(,)</code>
<code>resizeTo(h,v)</code>	Changes the size of the window to horizontal and vertical number of pixels	<code>window.resizeTo(,)</code>
<code>resizeBy(h,v)</code>	Changes the size of the window by + or - horizontal and vertical pixels	<code>window.resizeBy(,)</code>
<code>scrollTo(h,v)</code>	Scrolls the document in the current window or frame to horizontal and vertical pixel positions from top of document	<code>window.scrollTo(,)</code>
<code>scrollBy(h,v)</code>	Scrolls the document in the current window or frame by + or - horizontal and vertical pixel from current position	<code>window.scrollBy(,)</code>

Window Methods (WindowTimers)

Name	Description	Syntax
setInterval()	Evaluates an expression at specified intervals	<code>window.setInterval(<i>exp</i>, <i>time_interval</i>)</code>
clearInterval()	Used to clear a time interval set using the above method	<code>clearInterval(id_of_setInterval)</code>
setTimeout()	Evaluates an expression after a specified number of milliseconds	<code>window.setTimeout(<i>exp</i>, <i>time_interval</i>)</code>
clearTimeout()	Used to clear a timeout set using the above method	<code>clearTimeout(id_of_setTimeout)</code>

Example!

Assignments
