

Problem 1:

1. Run a container nginx with name my-nginx and attach volume to the container using volume mount
2. Volume for containing static html file
3. Edit the html content
4. Remove the container
5. Run a new container with the following:
 - o Attach the volume that were attached to the previous container using volume mount
 - o Map port 80 to port 8080 on you host machine
 - o Access the html files from your browser

problem2:

1. Create a Dockerfile.
2. Use an official Python image.
3. Copy the Python script into the image.
4. Run the script when the container starts

Problem 3:

- Create docker compose with:

Two services nginx and mysql

Add needed ports and environments for both services

nginx service is depending on mysql
